⚠ Elecraft manuals with color images may be downloaded from  
Introduction

The KAT3A option is an internally-mounted 100-watt automatic antenna tuner. This manual covers the installation of the KAT3A option in your K3S or K3 transceiver. Complete details for using the KAT3A are included in the K3S or K3 Owner’s manual.

Only a few basic hand tools are needed (see page 6) to perform the installation. No soldering or wiring is required.

Customer Service and Support

Technical Assistance
You can send e-mail to k3support@elecraft.com and we will respond quickly - typically the same day Monday through Friday. Telephone assistance is available from 9 A.M. to 5 P.M. Pacific time (weekdays only) at 831-763-4211. Please use e-mail rather than calling when possible since this gives us a written record of the details of your problem and allows us to handle a larger number of requests each day.

Repair / Alignment Service (We want to make sure everyone succeeds!)
If necessary, you may return your Elecraf product to us for repair or alignment. (Note: We offer unlimited email and phone support to get your kit running, so please try that route first as we can usually help you find the problem quickly.)

IMPORTANT: You must contact Elecraf before mailing your product to obtain authorization for the return, what address to ship it to and current information on repair fees and turn around times. (Frequently we can determine the cause of your problem and save you the trouble of shipping it back to us.) Our repair location is different from our factory location. We will give you the address to ship your kit to at the time of repair authorization. Packages shipped to Elecraf without authorization will incur an additional shipping charge for reshipment to our repair depot.
Preventing Electrostatic Discharge Damage

There is no climate or work location where the components of your K3s/K3 are safe from Electrostatic Discharge (ESD) unless you take specific steps to prevent such damage. Many of the components can be damaged by static discharges of only a few volts: far too little for you to notice. It is those low-voltage but destructive discharges that easily happen anywhere and under virtually any environmental conditions.

ESD damage may not be apparent at first. The damaged components may not fail completely. Instead, the damage may result in below-normal performance for an extended period of time before you experience a total failure.

How ESD Damage Occurs

Whenever an object containing a static charge touches a circuit current will rush into the circuit until the components reach the same voltage as the source of the static charge. If the voltage or current that passes through a component during that brief period exceeds its normal operating specifications, it may be damaged or destroyed.
Preventing ESD Damage

ESD damage cannot occur if there is no voltage difference between the components and any object that touches them. That is how anti-static packaging works. Anti-static bags allow the static charge to flow over their surface, so that any part of the bag that touches the components inside are all at the same potential at all times. Anti-static foam keeps the leads of sensitive components at the same potential.

At your work bench, avoiding a dangerous voltage is achieved most easily by tying everything together and connecting them to a common mains safety ground. This includes your K3s/K3 chassis, individual boards or other sensitive components as well as everything they may touch at the work table.

Inexpensive static dissipating work mats are readily-available that will steadily and safely drain off any charges built up on parts or circuit boards placed on them. They are supplied with a lead that connects the mat to the common workbench ground. Also, metal cabinets on test equipment used on the bench should be tied together and connected to the common ground.

Most importantly, you must have a way of continuously draining off any static charges that occur on your body. Such charges are easy to create, even while sitting quietly at the work bench. Moving your feet on the floor, shifting position in your chair or even moving your arms so that clothing rubs against itself can produce destructive static charges. You can discharge yourself by touching an unpainted metal ground, but that will last only until you move in a way that produces a new static charge. The safest technique is to wear a grounded wrist strap with a series 1-megohm resistor that continuously drains off any charges. Such wrist straps are readily-available and inexpensive.

**WARNING**

DO NOT attach a ground directly to yourself without a current-limiting resistor as this poses a serious shock hazard. A wrist strap must include a 1-megohm resistor to limit the current flow. If you choose to touch an unpainted, metal ground to discharge yourself, do it only when you are not touching any live circuits with your other hand or any part of your body.

We strongly recommend you take the following anti-static precautions (listed in order of importance) to avoid trouble:

- Leave ESD-sensitive parts in their anti-static packaging until you install them. The packaging may be a special plastic bag or the component’s leads may be inserted in conductive foam. Parts which are especially ESD-sensitive are identified in the parts list and in the assembly procedures.
- Wear a conductive wrist strap with a series 1-megohm resistor. If you do not have a wrist strap, touch a ground briefly before touching any sensitive parts to discharge your body. Do this frequently while you are working. You can collect a destructive static charge on your body just sitting at the work bench. DO NOT attach a ground directly to yourself as this poses a serious shock hazard.
- Use a grounded anti-static mat on your work bench.
- If you choose to use a soldering iron to work on your K3s/K3 for any reason, be sure your iron has an ESD-safe grounded tip tied to the same common ground used by your mat or wrist strap.
Preparing for Installation

Tools Required

1. #0 and #1 size Phillips screwdrivers. To avoid damaging screws and nuts, a power screwdriver is **not** recommended. Use the screwdriver that best fits the screw in each step.
2. Small pliers or a 1/4” nut driver.
3. Soft cloth or clean, soft static dissipating pad to lay cabinet panels on to avoid scratching.

The following tools are strongly recommended:

1. ESD wrist strap.
2. Static dissipating work pad.

Parts Included

The following parts should be included in your kit. Check to ensure you have them all. If any parts are damaged or missing, contact Elecraft for replacements (see *Customer Service and Support*, page 3).

Installation Procedure

**Removing the Top Cover**

- Disconnect power and all cables from your K3S or K3.
- Remove the nine screws to free the top cover as shown in Figure 1. After the cover is open, lift it gently to reach the speaker wire connector. Unplug the speaker then set the top cover aside in a safe place.

⚠️ Whenever you remove screws from a panel, if one screw seems too tight to loosen without damaging it, first loosen the other screws then try again. Sometimes one screw binds in its hole when the other screws are tightened.

![Figure 1. Removing K3S/K3 Top Cover.](image)

⚠️ **CAUTION:** Touch an unpainted metal ground or wear a grounded wrist strap before touching components or circuit boards inside the K3S/K3. See *Preventing ESD Damage* on page 5 for more information.

**Removing the KRX3A Sub Receiver Module**

If your K3S or K3 is equipped with the optional sub receiver, you must remove the sub receiver module to install the KAT3A. The sub receiver module is the “L” shaped metal enclosure (see Figure 2). Remove the sub receiver module as follows:

- Remove the chassis stiffener bar that runs across the top of the K3S/K3 chassis and is attached to the side panels. If the KPA3A or KPA3 amplifier is installed, the stiffener will be attached to the amplifier shield by two screws. These screws may have nuts and lock washers or they may thread into permanently-attached PEM nuts on the stiffener bar.
Remove the two 1-1/2” (38 mm) screws and lock washers shown in Figure 2. These screws extend all the way through the sub receiver module and secure it to standoffs mounted on the main RF board.

![Figure 2. Removing the KRX3 or KRX3A Module.](image)

⚠️ In the following steps you will handle small TMP coaxial connectors. These are friction-fit connectors shown in Figure 3. Handle the connectors by the grips as shown. Do not pull on the coaxial cable.

![Figure 3. TMP Cable Connectors.](image)

Hold the sub receiver module by the two brass knurled nuts on the top, and lift it straight up to gain access to the small TMP coaxial connectors plugged into the module. There are two along the front. There may be one at the back as well, depending upon the options installed. As you lift the sub receiver module, it will unplug from two small interface circuit boards. One is at the front and the other is at the rear. These small boards may come out with the module or they may remain attached to the main RF board.

Unplug the TMP coaxial cables leading to the sub receiver module, then lift the module free and set it aside.

Locate the two small interface circuit boards, remove them and put them in a safe place.
Removing the Right Side Panel

- Remove the hardware securing the heat sinks of U13 and U12 to the right side panel (see Figure 4). Be careful not to lose the lock washers inside the K3s/K3.

![Figure 4. U13 and U12 Mounting Hardware.](image)

- Remove the screw holding the KANT3/KANT3A board to the standoff and the screw holding the 2D fastener to the rear panel near the SO239 antenna connector shown in Figure 5. Do not lose the lock washer inside the K3s/K3. It is easier to keep the hardware from falling inside if you set the K3s/K3 on its side feet and remove the screw and lock washer holding the KANT3/KANT3A board first, then set it on its bottom feet and remove the flat head screw from the 2D fastener.

![Figure 5. Removing Side Panel Hardware Part 1.](image)
Remove the five screws shown in Figure 6 from the right side panel to release it. The side panel will lift off with the 2D fastener and standoff shown in Figure 5 attached.

**Figure 6. Removing Side Panel Hardware, Part 2.**

**Removing the KANT3A/KANT3 Module**

Unplug the antenna connection to the KANT3A/KANT3A board (see Figure 7) then unplug it from the RF board and lift it out. Flex the back panel outward slightly as needed to clear the edge of the board. Holding the KANT3A/KANT3 board at the top corners, rock it back and forth as needed to release the connector.

**Figure 7. Removing KANT3A/KANT3 Board.**
Installing the ANT2 Connector

- Remove the dummy plug from the ANT 2 connector hole in the back panel. The plug is released by squeezing two tabs on opposite sides (see Figure 8).

![Figure 8. Installing ANT 2 Connector.](image)

- Install the SO239 coaxial connector in the ANT 2 space using the hardware shown in Figure 8. If the optional sub receiver AUX RF connector is installed, remove the 3/8” (9.5 mm) black pan head screw and associated hardware from the lower hole, then use the same screw to replace the AUX RF ground lug as shown in Figure 9.

![Figure 9. Installing AUX RF Ground Lug.](image)

⚠️ As you install components and reassemble your K3S/K3, be sure all the screws are in place and secure, but do not over tighten them. Failure to tighten all screws may result in poor shielding of sensitive components, resulting in possible noise or birdies in the receiver as well as other difficult-to-trace problems.

Installing the KAT3A Module

- Plug the KAT3A board into P70 on the RF board. **Wear a wrist strap or touch an unpainted metal ground before handling the boards.** Flex the back panel slightly as needed for the board to clear the lip at the top, just as you did when removing the KANT3 board. If the AUX RF connector is installed, route the coaxial cable between the KAT3 board and rear panel as shown in Figure 9.
Plug the connectors on the wires leading to the ANT 1 and ANT 2 jacks into the KAT3A board as shown in Figure 10. ANT 1 goes to the connector nearest the rear panel, and ANT 2 goes to the one farthest from the rear panel as shown. Support the top of the KAT3A board when plugging in these connectors. The fit may be very tight and the KAT3A board does not have any mechanical support at the top yet.

Figure 10. Installing the KAT3A Board.

Replace the right side panel on the K3s/K3, installing the screws shown in Figure 6 first. Use the 4-40 3/16” (4.8 mm) screws you removed earlier.

Replace the 4-40 1/4” (6.4 mm) zinc pan head screw and washer that holds the KAT3A board to the standoff as shown in Figure 5.

Replace the 4-40, 3/16” (4.8 mm) black flat head screw that secures the back panel to the 2D fastener as shown in Figure 5.

Replace the two 4-40 3/8” (9.6 mm) black flat head screws, lock washers and nuts to secure the heat sinks of U13 and U12 to the side panel as shown in Figure 4.

Reinstalling the Sub Receiver Module

If your K3s/K3 does not have a KRX3A or KRX3 sub receiver, go directly to Replacing the Top Cover on page 13.

If your K3s/K3 is equipped with the sub receiver, turn to your KRX3 or KRX3A Sub Receiver Installation and Operation manual, Installing the Sub Receiver Module section to replace the module. Be especially careful to do the following as described in that procedure:

- If you have a K3 (not a K3s), be sure the cover on battery BT1 on the RF board is in place. The cover is essential to avoid shorting the battery. The outer rim of the battery is the positive terminal, and may come in contact with the grounded bottom of the sub receiver enclosure if the cover is not in place. The K3s battery lies flat on the board and needs no protective cover.

- Be sure all the TMP cables are properly connected or your K3s/K3 will not operate properly.
Replacing the Top Cover

Hold the top cover above the K3S/K3, route the speaker wire under the stiffener bar and plug it into P25 on the KIO3A/KIO3 board at the left rear of the chassis as shown in Figure 11.

![Figure 11. Connecting Speaker Cable.](image)

Position the top cover on the K3s/K3. Note that the tab on the back center goes under the rear lip of the rear panel. Secure the top cover with the nine 4-40 3/16” (4.8 mm) black flat head screws you removed earlier.

⚠️ **REPLACE ALL THE SCREWS**!

The K3s/K3 chassis has excellent rigidity despite its light weight. The screws that hold the top cover in place are an important part of the structural design. Be sure to replace all the screws and verify they are tight whenever you replace the cover or other panels.

Enabling the KAT3A

⚠️ Your KAT3A will not operate correctly until the following steps are completed!

Reconnect power and antenna (or dummy load) to your K3s/K3 and turn it on. Enable your KAT3A ATU using the `CONFIG` commands as described in the Owner’s Manual.

This completes the installation of the KAT3A automatic antenna tuner in your K3s/K3.
